Claims

- Device for determining the partial pressure of at least one gas in a mixture of end expiratory gases comprising:
- a receiving unit for receiving a volume of end expiratory gas
- at least one measuring device to determine at least one gas in the end expiratory gas volume and to generate measurement signals; and
- a unit for display and/or storage and evaluation for recording and further processing of the signals of the at least one measuring device.
- 2. Device according to claim 1, characterized therein, that the at least one measuring device is an optical measuring device.
- 3. Device according to claim 2, characterized therein, that the at least one measuring device is an IR-measuring device.
- 4. Device according to claim 4, characterized therein, that the measured values are stored together with datum, individual data of the individual to be monitored.
- 5. Device according to one of the preceding claims, characterized therein, that the measurement of the partial pressure of a gas, like pCO2, is made in the end expiratory gas by IR-absorption of a predetermined gas volume in a predetermined wavelength area in a measurement device.

- 6. Device according to on of the preceding claims, characterized therein, that it comprises a device for absorbing water from the end expiratory gas.
- 7. Device according to claim 6, characterized therein, that it comprises an IR measuring cell, that measures the IR-absorption of CO2, whereas the signal of the IR measuring cell can be stored together with time data, like datum, time or the name of the patient in a memory.
- 8. Device according to claim 8, characterized therein, that the stored individualized measurement data are comparable with already stored data by a program, whereas a signal is generated if a deviation greater than a predetermined value occurs.
- 9. Device according to any of the preceding claims, characterized therein, that it comprises an oxygen sensor.
- 10. Device according to any of the preceding claims, characterized therein, that the end expiratory gas volume is the end expiratory gas volume.
- 11. Device according to any of the preceding claims, characterized therein that it is a device for monitoring the breathing function, a device for determination of ovulation or a device for monitoring the lung function.
- 12. Device according to any one of the preceding claims, characterized therein, that it comprises an own power supply and is portable.
- 13. Method for monitoring fluctuations in the respiratory metabolism of the human or animal body, characterized by the steps:

- obtaining a volum of an end expiratory gas mixture;
- measuring the amount of one or more gases contained in this volume;
- recording of the thus obtained value optionally together with time and individual data;
- comparing the value/s with a value table and
- generating a signal according to the comparison step, that can be stored, optionally further processed an/or edited.
- 14. Method according to claim 13, characterized therein that the gas measured is CO2 or O2.
- 15. Method according to claim 13 or 14 characterized therein, that the amount of the at least one gas in the end expiratory gas mixture is determined optically.
- 16. Use of the device according to one of the claims 1 12 to determine the breathing function, to monitor oxygen therapy, the fitness in physical exercise.
- 17. Use of the device according to one of the claims 1 12 for determining ovulation by determination of the amount of pCO2 in end expiratory gas.
